THE PROBLEM

When the towers go down, rescue goes blind

Every cyclone and flood season, districts lose mobile coverage for hours or days, as in the 2015 Chennai floods and Cyclone Michaung in 2023. That is exactly when people most need help.

People can’t call for help

Trapped families, the elderly and patients can’t call, text or share their location.

Control rooms work blind

No view of who needs help, where they are, how many people, or how urgent.

Chat apps aren’t enough

They don’t reach rescuers or prioritise, and they drain the phones that relay for others.

THE SOLUTION

A complete rescue loop on phones people already own

1

Ask for help

One-tap SOS with GPS and a situation report, scored 0–100 for urgency.

2

Phones relay

Bluetooth and Wi-Fi mesh. Battery-aware routing; most urgent first.

3

Rescuers carry

Boats and NDRF teams carry stuck SOS out of dead zones.

4

Control room sees

The first phone with signal uploads to a live, urgency-sorted map.

5

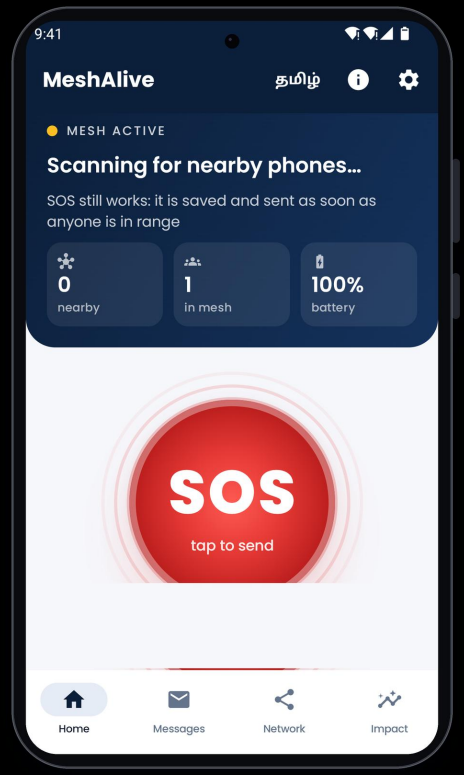

Help comes back

Dispatch and evacuation alerts reach phones with no signal.

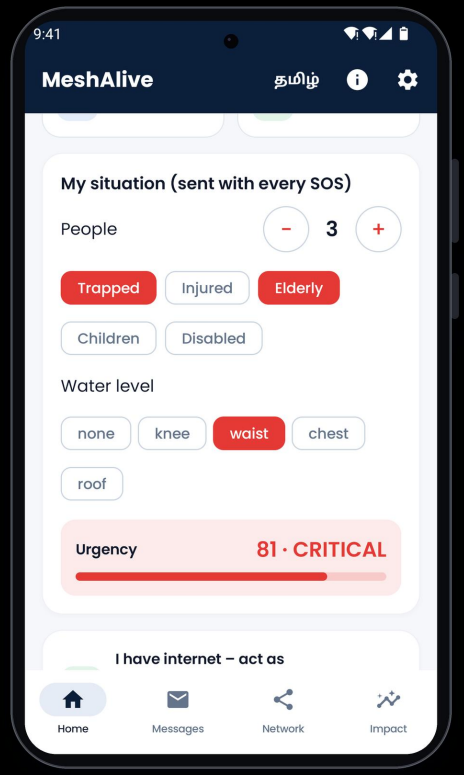

No towers · No internet · No extra hardware · Tamil and English

THE APP

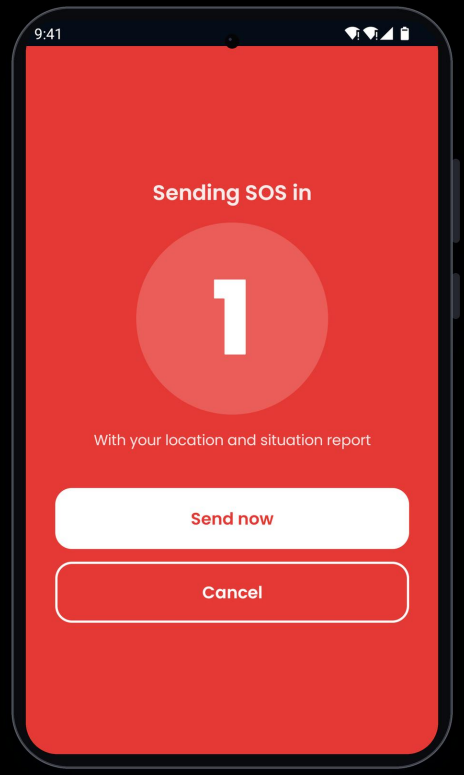

Built for the worst day of someone’s life

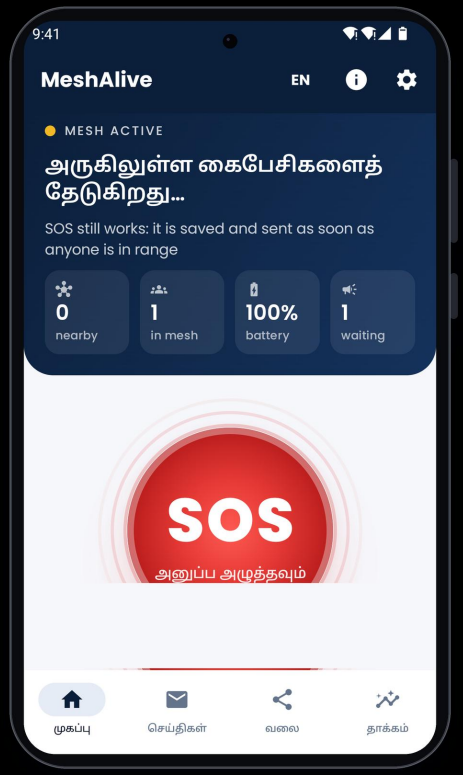

Live mesh status and one-tap SOS

Situation report → urgency 81 · Critical

3-second countdown: no false alarms

Fully in Tamil

WHY IT'S DIFFERENT

A rescue system, not a chat app

	Chat apps (Bridgefy, Briar)	LoRa radios (Meshtastic, goTenna)	MeshAlive
Reaches rescuers	No	No	**Live district dashboard**
Help back to the victim	No	No	**Dispatch + evacuation alerts**
Prioritises urgent cases	No	No	**Triage score 0–100**
No phone in range	Message waits	Message waits	**Rescue carriers carry it out**
Battery	Flooding drains phones	Flooding	**Battery-aware routing**
Extra hardware	None	₹2,500+ per person	**None**
Language	English	English	**Tamil and English**

EVIDENCE

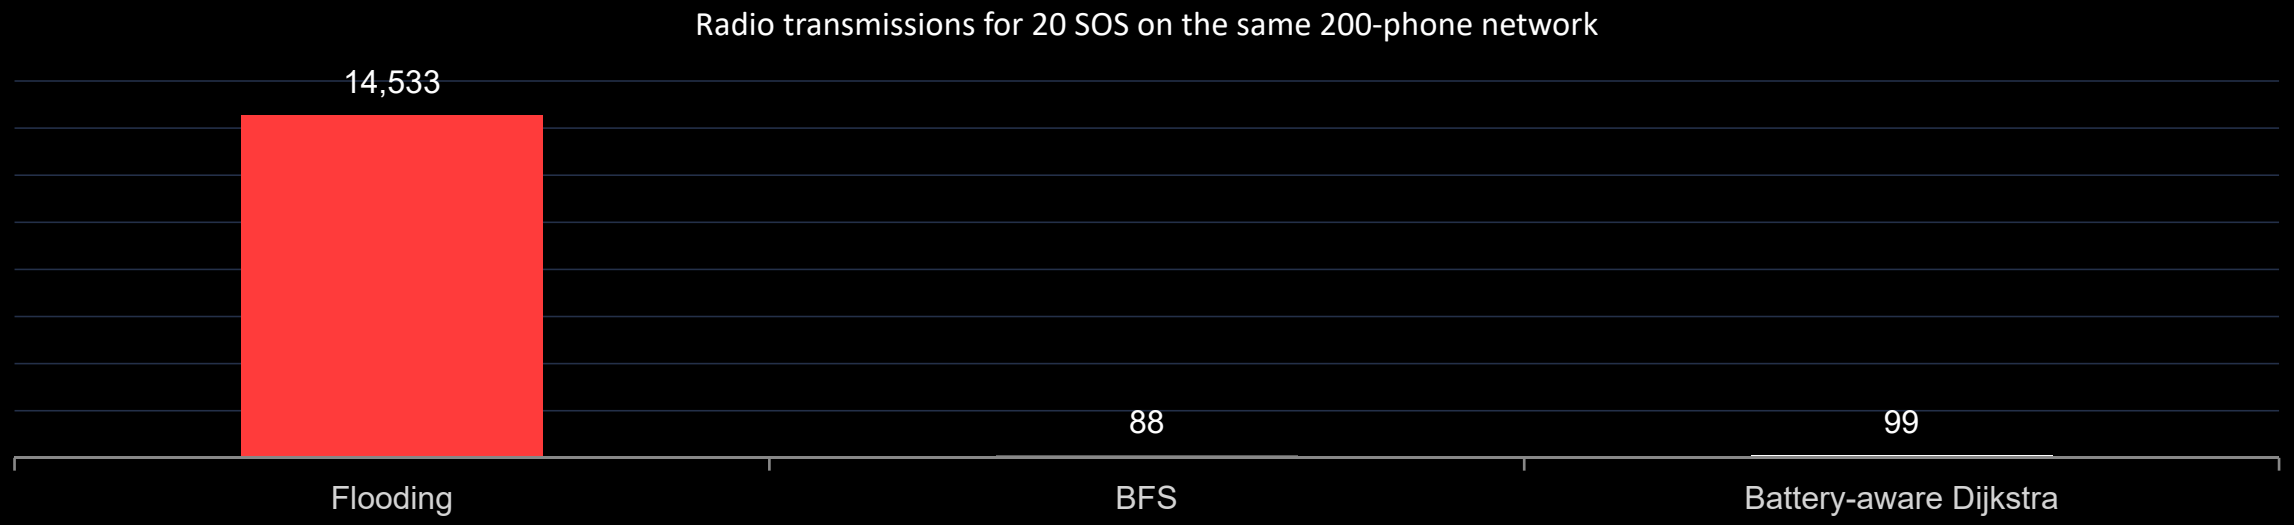

Built, tested and measured

100%
SOS delivered (200-phone simulation)

147×
fewer radio transmissions than flooding

2×
battery left on the weakest phone

49
automated tests

PATH TO DEPLOYMENT

From one ward to every district

PHASE 1 · 3 MONTHS

Field pilot

One flood-prone ward with the DDMA, NDRF/SDRF boats as carriers, dashboard in the district EOC. Measure delivery rate and SOS-to-dispatch time.

PHASE 2

District rollout

Pre-monsoon install drives via schools, colleges, panchayats, ULBs and SHGs, guided by the planner’s adoption targets.

PHASE 3

State & national

Distribution through the SDMA; state EOC integration; alerts aligned with the national Common Alerting Protocol; more Indian languages.
